

Do you want *your* Pipes looking like this?

How do you prevent this?

To prevent this, ugly pipe, **DO NOT** put fats, oil, or grease down your drain.

Why does this happen?

When you put fats, oil, and grease down the drain they start to cool down. After they are cool they will stick to your pipes. After that happens for years your pipes will get clogged and overflow.

How do I dispose of fats, oil, and grease?

You put it in a can, let it cool. Then dispose in your trash can. This is good for your pipes and the environment. Do your part and help out your community!
